1. Architectural Core & Value Proposition

Definition & Overview

My understanding of cloud computing is that it provides computing resources such as servers, storage, networking, and databases over the internet on demand. Instead of buying expensive hardware, organizations can rent resources whenever they need them. I learned about public, private, and hybrid cloud deployment models along with service models such as IaaS, PaaS, and SaaS. Cloud computing offers scalability, flexibility, high availability, disaster recovery, and cost optimization, making it an essential technology for modern software systems. I feel this concept is highly relevant in today's software industry because organizations demand faster delivery, reliability, security, and scalability. Through this module I gained a practical understanding of why these technologies are widely adopted and how they support enterprise application development.
